

PHASE 8

Project Demonstration Phase

EduGenie - AI Powered Learning Assistant

Provide a structured demonstration script, evidence checklist, expected outputs, and presentation sequence for project evaluation.

Prepared as a phase-wise academic submission document based on the supplied EduGenie-Ai project archive.

1. Demonstration Objective

Demonstrate the complete EduGenie user journey from opening the application to selecting a learning task, sending input, receiving AI-generated output, interacting with quiz content, and verifying service status.

2. Recommended Demo Sequence

1	Start the FastAPI server	Terminal showing successful startup
2	Open the application root page	EduGenie interface in browser
3	Run Question Answering	Question entered and answer displayed
4	Run Explanation	Topic entered and explanation displayed
5	Run Quiz	Questions and options displayed; select an option for feedback
6	Run Summarize	Passage entered and concise summary shown
7	Run Learning Recommendations	Topic + level used to produce a learning path
8	Run /health	Browser or API client shows status ok
9	Demonstrate copy/clear	Result copied and interface reset
10	Conclude with architecture and testing	Project files, API routes, and test evidence summarized

3. Sample Demonstration Inputs

Question Answering	What is a data structure?
Explanation	Explain object-oriented programming in simple terms.
Quiz	Python programming basics
Summarize	Paste a short textbook paragraph about algorithms.
Learning Recommendations	Data Structures and Algorithms; choose an appropriate learner level.

4. Expected Demonstration Results

- Readable natural-language responses for the text tasks.
- Quiz output containing questions, options, and a correct-answer field used by the interface for feedback.
- Learning recommendations presented as sequential guidance or path steps.
- Visible status message during generation and clear error feedback when requests fail.

5. Presenter Talking Points

- EduGenie centralizes several study activities inside one simple learning workflow.
- FastAPI separates web routing from individual learning functions.
- The frontend uses asynchronous requests so the page does not need a full reload for each task.
- AI configuration is externalized through environment variables.
- The project includes a dedicated health endpoint to support quick service verification.

6. Demonstration Readiness Check

Backend	All imported modules exist and server starts cleanly
Frontend	index.html contains every DOM id used by app.js
AI	A valid Gemini credential and network connection are available
Quiz	A valid structured quiz response is rendered without console errors
Security	No secret is shown in screen recording, PDF, or public ZIP
Testing	High-priority tests have recorded evidence

7. Final Demonstration Note

The supplied project snapshot should not be demonstrated as fully complete until the missing Python modules and empty HTML template are restored or implemented. Once those items are completed and verified, this phase can serve as the final evaluator-facing script and evidence checklist.

8. Closing Statement

EduGenie demonstrates the integration of a web application architecture with generative AI to support common study workflows. The phase-wise submission shows the project lifecycle from idea through requirements, design, planning, development, testing, documentation, and demonstration.
